

Diet - Instar 6-Adult (cont'd): If you feed your mantis Blue Bottle fly larvae or moth larvae (I've done it many times without issues), but some people have issues with their mantis because the larvae can have bacteria on them. Please do your research and decide for

Hydration: – **Orchid mantises need to drink every day.** Please use filtered / reverse osmosis water / bottled water (mineral free) to mist your mantis's enclosure 2x daily. You will see your mantis use it's raptors to drink from, or the sides of the enclosure (it's So cute to see them drink!).

** Do not spray the mantis directly. Mantises breathe from their abdomen. If you spray them, they may not be able to breathe. ** Use spray bottles with a fine mist, not large water drops. Young mantises can drown.

Heat / Humidity: – **Orchid mantises are a tropical species.** They need heat of 78 – 85 degrees, and higher humidity of 65-80%. A hygrometer (Amazon has many options) is helpful to check humidity in your home. Misting your mantis's home 2x daily will keep humidity levels higher. You can use sphagnum moss, coco fiber, paper towels to line the enclosure's base. If your enclosure is not bioactive, clean out the enclosure once or twice a week. Mantises do poop! Poop can cause bacteria / mold in enclosure.

Enclosure: – **Your Orchid mantis needs an enclosure that's a minimum of 3x it's body length, and 2x it's body width.** The deli cup you're getting with this purchase can be your mantis's home for several months more.

- Other enclosure options – Acrylic enclosures with lots of cross ventilation. We like Zilla habitats (available on Amazon). Glass enclosures (Reptizoo, Zilla) work well as long as they have mesh sides for cross ventilation. Mesh butterfly cubes are fine, as long as you can retain humidity. Glass jars are not suitable unless you can create ventilation on the sides.
- Your mantis likes to hang from the top of the enclosure. I recommend using hot glue to glue fine mesh (like organza) or shelf gripper (the rubber kind) so that your mantis has a good grip to molt safely. Metal mesh can harm a mantis's feet. You can hotglue mesh / gripper on metal.
- ** Hot glue is okay to use for your mantis enclosure. Try to pull out as many glue strands as you can. Let cool thoroughly before putting your mantis in.
- ** If you choose a very large enclosure for your mantis, it may not be able to catch it's prey successfully. – though it will enjoy exploring it's awesome home! You may want to feed it in a deli cup.

Enclosure considerations: – bioactive enclosures work great for Orchid mantises, as long as isopods don't hurt your mantis if it falls. Springtails are just fine.

- Orchid mantises LOVE to climb and explore, so putting branches and flowers is great. Do not put branches too low to the bottom.
- You want your mantis to molt from the highest place possible so that it has plenty of space. Do not overcrowd the habitat with branches because your mantis will need room to molt.

Molting: – **Mantises outgrow their exoskeleton as they eat and grow. They need to molt (wiggle out of their exoskeleton).** Your mantis will molt 7-9 times depending on it's gender. Male orchid mantises molt 7x, females molt 9x to reach adulthood. When they're adults, they get their wings!!

- Mantises molt more frequently while they're younger. Their final molt to adult can take several months.

Main signs of Mantis getting ready to molt – It stops eating. It stays in one place. It's abdomen begins moving up and down a lot. It flicks away it's prey and seems bothered by the prey. Abdomen looks swollen even though the mantis has not eaten in a few days. Mantis turns more pink. **More signs info on Mantis Keepers Official.

- ** Do not disturb your mantis, move it, try to give it food when you see this behavior. Give your mantis a few days to molt. Do not feed it for 24-48 hours after it molts, though hydrate it as usual.

Thank you! I hope you have a wonderful time learning and growing with your new pet!

Orchid Praying Mantis !!

Hymenopus coronatus Care Guide

Awesome Fun Fact!! I am such a clever insect! Not only do I look like a flower to attract flying insects (my prey in the wild), but I emit UV rays just like a flower!! My prey thinks I'm a legit flower, flies over to me, and I get my meal! I AM the Kung-Fu mantis !!

Hi! I'm Luke. I've been raising praying mantises since I was 8 years old. I'm the kid whose mantises were shown on **Snake Discovery**!! I got to show amazing mantises on **CBS show Kids Say The Darndest Things with Tiffany Haddish (Season 2, Episode 12 -Jitterbug)**. - My mission is to show people how amazing mantises are, and how fun and clever their behaviors are! If we love insects, we'll do more to save their environment! I've raised and bred many Orchid mantises and learned a lot along the way. I hope you find my guidelines helpful. I encourage you to find awesome groups like **Mantis Keepers Official** on Facebook if you need guidance in raising Orchid manties. I also plan to do a series of videos about their care. Please follow me on Youtube at **Luke's Bug and Animal Adventures** so you can hang with me as we raise mantises together! **#LukeBugAdventures**

You are buying an Instar 2-Instar 3 Orchid Mantis. Congratulations! Orchid Mantises are such fun to raise! They're amazing animals, with a fierce prey drive, and clever camouflage! Watching them hunt down their prey is an education in survival!! Orchid mantises are generally not a beginner species, but they were my beginner mantis! My family and I raised them to adult by getting lots of help from Mantis Keepers Official.

Diet – Facts for successful molt -** For your mantis to molt successfully, it needs a lot of internal moisture as well as external moisture. The more moisture content your mantis can eat from their prey, the greater their chances for a good molt. Giving them juicy prey items are important for this reason (and they plain love them haha)

Diet - Instar 2 – 3- Orchid mantises eat 2-3x weekly. They eat mainly Hydei fruit flies – the jucier and larger, the better! Orchid mantises are fierce eaters, and will chase down their prey. They can be fed in their enclosure or in a separate deli cup, if you're keeping count of how many fruit flies they've eaten. **Put no more than 4 fruit flies in their enclosures – too many prey items can stress a mantis out. Too much prey can also hamper an Orchid mantis molting safely, if the prey item is roaming around their enclosure while the mantis is trying to molt.

**** Do not ever feed your mantis Black Soldier Fly larvae or flies. They're problematic feeders, and many mantises have died after being fed that.**

Diet - Instar 4 – Instar 5 – Your mantis pet can now begin eating house flies. They will also eat size-appropriate crickets, moths, moth larvae (occasional treat because it's fatty), small hornworms (from reptile stores, not from tomato plants), butterflies, mealworms, butterworms, silk worms. Worms can bite, so make sure it's a small worm to introduce to your mantis. Feed your mantis a small amount first to make sure your mantis enjoys it's meal and can handle it.

Diet - Instar 6-Adult – Your mantis can easily eat larger flies like Blue Bottle flies, crickets, meal worms, moths, hornworms, silkworms, silkworm moths, other moths. If you feed wild caught prey to your mantis, you may feed it pesticides, so please be aware of risks.
